                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TD37-FL The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a M.tuberculosis (for treatment or prevention).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tuberculosis - are

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, Tb37-FL. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.

This polypeptide comprises Mycobacterium tuberculosis antigen Tb37-FL. It is encoded by genomic DNA isolated from a M. tuberculosis strain H37RV genomic library using a probe from clone Tb38-1 (see AAV44384). The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM464399) comprising an antigent portion of a soluble M. tuberculosis antigen, or an immunogenic portion of a soluble puberculosis antigen, and immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis

This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag. Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion tuberculosis-immune subjects. AAX19249 to AAX19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                 New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions

This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                            seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-embl/AA1999.DAT:AAY38992

The present sequence is that of the Mycobacterium tuberculosis MTBN3 protein. This is 1 of 8 proteins, i.e. MTBN1-8 (see AAB1942-49), encoded by 8 open reading frames (see AAA89035-42) identified as being present in the genome of M. tuberculosis but absent from the genome of the BCG strain of Mycobacterium bovis. WTBN1-8 represent reagents that are useful in discriminating between M. tuberculosis and BCG and, in particular, for diagnostic methods which discriminate between exposure of a subject to M. tuberculosis and vaccination with BCG. The invention features these MTBN polypeptides, functional fragments of them, DNA encoding them, vectors, transformed cells, and diagnostic, therapeutic, and prophylactic (vaccine) methods, including genetic vaccination methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptide encoded by open reading frames present in Mycobacterium tuberculosis genome and not by the BCG strain of M. bovis, useful as vaccine and for diagnosing tuberculosis infection
                                                                                                                                                                                                                                                                                                                                                                               seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA2001.DAT:AAB19844

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis.
                                                                                                                                                                               for
                                                                                                                                                                            New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis
                                                                                         PB;

(STAT-) STATENS SERUM INST

Andersen P, Skjot R;

WPI; 1999-347282/29. N-PSDB; AAX81046 New immunogenic fragment of Mycobacterium tuberculosis

Example 2; Page 219-220; 265pp; English.

The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a profective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion to the tuberculosis complex. The invention provides a (1) fusion of fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAT-6, or MPT59 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for are useful as pharmaceuticals, for diagnosis of and as antigens for contraction and an animal with bacteria belonging to the previous sensitization in an animal with bacteria belonging to the cuberculosis complex. The invention also describes the use of CFP7A or CFP30A. The polypeptides of for the induction of a strong immune response in a mammal; use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell epitope of for the preparation of an immunological composition; and cell epitope of for the preparation of an immunological composition; and contract the preparation of a subunit vaccine.

The present invention describes a bioreactive polypeptide (or immunologically equivalent analogue) produced in lactic acid bacteria which vertex with lymphoid cells primed with Mycobacteria d.M. tuberculosis.

Complex mycobacteria (M. tuberculosis, d. africanum or M. bovis). The complex mycobacteria.

Coffagnosis of and vaccination against tuberculosis caused by tuberculosis complex mycobacteria. The ESAT-6 polypeptide can be used diagnose ongoing/previous sensitiaation with these bacteria by detecting cytokine release when contacting blood samples with the polypeptide. The bioreactive polypeptide may be used in diagnostic compositions and vaccines for mycobacteria other than of the polypeptide. The bioreactive polypeptide may be used in diagnostic complex, e.g. M. avium which infects poultry and occasionally humans, M. leprae; they are especially useful when they do not react with lymphoid cells previously primed with M. tuberculosis complex mycobacteria and so do not give rise to a diagnostic reaction in Individuals infected with these bacteria. The polypeptides may also be used in in vitro diagnostic tests e.g. stimulation of interferon-gamma complex type hypersensity vity (DTH) skin test for tuberculosis, but may have greater specificity, being better able to discriminate between lymphore represent and presented and the mycomplex may contain the reaction of the present sequence from previous vaccination. The present sequence from the present sequence and the present sequences and the present seque
                                                                            ' mycobacterial polypeptide produced in lactic acid bacteria, useful
tuberculosis diagnosis and vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents M. tuberculosis ESAT-6 used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         522 AGCATGCCAGAGATGAAGACCGATGCCGCTACCCTCGGGCAGGAGGCAGG 571
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         !!!::::!||:::

```
The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the w. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacterial or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid containing regulator and LHP gene of Mycobacterium tuberculosis - useful in vaccines, for diagnosis, and for expression of heterologous proteins

    polynucleotide may be used to express almost any heterologous protein in mycobacteria, particularly as a fusion with polyhistidine. The two proteins encoded by the polynucleotide, LHP and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune respigns. The present sequence represents the LHP polypeptide.

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis,
                                                      for
                                                 New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      568
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       420

This sequence represents the fusion protein TbF-2 which is composed of immunogenic polypeptides from Mycobacterium tuberculosis (MT). This protein is used in a method for inducing protective immunity against tuberculosis (ME). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of TB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tuberculosis; immunogenic; soluble; antigen; protective immunity; TB; vaccine; pharmaceutical; infection; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis

                                                                                                                                                                                                      489
                                                                                                                                                                                                                                                                                                            822
```

This polypeptide comprises a fusion protein, designated TDF-2, composed of Mycobacterium tuberculosis antigens TbRa3 (see AAM64295), 30 kDa antigen (see AAM64364), Tb38-1 (see AAM64321) and DDEP (see AAM64322). It was produced by PCR amplification (see AAW44450-57) of the appropriate antigen DNA sequences, cloning into an expression vector, and expression in E. coll. TBF-2 can be used for serodiagnosis of tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64291-W64379) compositions of see AAM64291-W64379) compositions of the tuberculosis antigens, or fusion proteins, DNA sequences encoding such polypeptides, recombinant expression

TUBERCULOSIS

```
seq_documentation_block:

Sequence 117, Application US/08818112

Patent No. 6290969

GENERAL INFORMATION:

APPLICANT: Reed, Steven G.

APPLICANT: Skeiky, Yasir A.W.

APPLICANT: Campos-Neto, Antonio

APPLICANT: Campos-Neto, Antonio

APPLICANT: Vedvick, Thomas S.

APPLICANT: Tanaditon, Raymond

APPLICANT: Tanaditon, Raymond

TITLE OF INVENTION: COMPOUNDS AND METHODS FOR IMMUNOTHERAPY

TITLE OF INVENTION: AND DIAGNOSIS OF TUBERCULOSIS

NUMBER OF ERQUENCES: 153
